

iMersSUPA — Final Clean Installation Guide v1.1

Fresh client installer • 24 September 2026

A. Supabase

- Create a new Supabase project and open SQL Editor.
- Run **supabase/install/00_FULL_FRESH_INSTALL_IMERSSUPA.sql** once.
- Replace the placeholder email in **01_BIND_FIRST_SUPER_ADMIN_BY_EMAIL.sql** with the client's Supabase Auth email, then run it.
- Run **02_VERIFY_INSTALLATION.sql**.
- The consolidated fresh-install SQL already includes the latest checkout, payment-method, and notification lifecycle fixes.

B. Frontend

- Copy **.env.example** to **.env.local**.
- Fill **NEXT_PUBLIC_SUPABASE_URL** and **NEXT_PUBLIC_SUPABASE_PUBLISHABLE_KEY**.
- Run **npm install**, **npm run build**, and **npm run start**.

C. First Admin Configuration

- Configure branding, WhatsApp provider/gateway, Email provider, Payment Methods, and Commerce settings.
- No bank account, QRIS image, gateway token, email credential, or provider secret is hardcoded.

D. Payment Methods

- Open Admin → Payments → Payment Methods and add the client's actual payment methods.
- A fresh installation intentionally contains no real client payment account details.

E. Notification Lifecycle

- Order Created, Payment Waiting Verification, Payment Approved, Payment Rejected, Payment Failed, Order Completed, Order Cancelled, Order Expired, and Order Refunded are wired into the notification dispatcher.
- Transactional Email and WhatsApp are queued whenever the corresponding buyer contact exists. Provider credentials remain configurable in the admin settings.

F. Verification

- The verification SQL checks required tables, storage buckets, payment methods, the 27 active transactional templates, commerce notification triggers, critical checkout/payment functions, and recent outbox activity.

G. Important

- This package is for a fresh client installation. Do not run the complete fresh-install SQL over an existing production database.
